Bogotá - Colombia

<https://javiermorenof7.github.io/cv/portafolio/links/index-en.html>

Technology Stack (Skills)

Cloud & Architecture: GCP, AWS, Azure, Data Lakehouse, Medallion Architecture, Big Data.

Processing & Orchestration: Databricks, PySpark, Airflow (Composer, MWAA), ADF, ETL/ELT Pipelines.

Data Warehouse & Storage: BigQuery, Redshift, Synapse, GCS, S3, ADLS, PostgreSQL.

Languages & Tools: Python (Polars), Advanced SQL, Scala, Git, Kubernetes, Power BI, Tableau.

Estudios Realizados

Undergraduate

Degree: Industrial Engineering

University: Jorge Tadeo Lozano | February 2014 - August 2018

Graduate

Degree: Master's in Integrated Management Systems (Specialization in Data Engineering)

University: Universidad Internacional de La Rioja (UNIR) | November 2018 - 2020

Complemento

Very important: To see more, access my virtual portfolio at the following link

Professional Profile

Data Engineer with over 5 years of experience designing and implementing high-impact data solutions across the financial, retail, and logistics sectors. Specialist in building Data Lakehouse and Data Warehouse ecosystems using the Medallion Architecture, deployed in Multi-Cloud environments (GCP, AWS, Azure). I have successfully led critical migrations from on-premise systems to the cloud, achieving a 45% reduction in processing times and a 200% increase in operational accuracy. Expert in the automated orchestration of high-performance ETL/ELT pipelines using Apache Airflow (Cloud Composer, MWAA). I possess advanced proficiency in large-scale data storage and processing solutions (BigQuery, Databricks, Cloud Storage (GCS), Amazon S3, AWS Redshift, Azure Data Lake Storage (ADLS), and Azure Synapse). I combine a robust technical stack (Python, Scala, PySpark, Polars, SQL) with an analytical business mindset to transform complex data into sustainable competitive advantages.

Work Experience

Banco Falabella | Data Engineer | January 2023 – March 2026

Reduced processing times by 45% by migrating on-premise systems to multi-cloud ecosystems (GCP, AWS, Azure) under a Medallion Architecture. Designed scalable Data Lakes and ETL/ELT pipelines, centralizing massive distributed data processing with Databricks and analytical engines (BigQuery, Redshift, Synapse). Standardized critical operations by orchestrating automated workflows using Cloud Composer, Amazon MWAA, and Azure Data Factory. Ensured the ingestion of sensitive data into the Raw/Bronze layer of the Data Lake under strict cloud encryption protocols.

Key Technologies: GCP, AWS, Azure, Python, Scala, BigQuery, Redshift, Synapse, Cloud Composer, MWAA, ADF, ETL/ELT.

Factor IT | Data Engineer | April 2022 – January 2023

Increased data adoption by 35% by designing scalable cloud ETL pipelines to feed Big Data ecosystems and analytical models. Structured massive data volumes by applying a Medallion Architecture, performing distributed cleansing and transformation through Databricks (PySpark). Optimized processing, delivering strategic insights through data architectures natively hosted in cloud environments.

Key Technologies: Python, Big Data, IBM Cognos, Power BI, Git, ETL, SQL.

BBVA | Data Engineer | November 2021 – April 2022

Eliminated reliance on Excel by automating ETL extractions from transactional databases to cloud repositories, transforming raw data into analytical views with Databricks. Enabled real-time Big Data analytics by implementing data flows and semantic layers connected to dynamic visualization dashboards. Simplified complex data engineering pipelines, ensuring distributed processing, version control, and high availability across multi-cloud ecosystems.

Key Technologies: Python, Big Data, IBM Cognos, Power BI, Advanced Statistics, ETL.

Aviomar Grupo Empresarial | Data Process Engineer | February 2020 – October 2021

Improved operational accuracy by 200% by designing a centralized Big Data cloud architecture from scratch for three companies. Integrated systems (CRM, ERP, WMS) through native ETL processes, consolidating corporate information. Structured optimized data layers to enable consumption in segmentation models and profitability analysis.

Key Technologies: Cloud Databases, Big Data, ETL/ELT Pipelines, PostgreSQL, Data Integration.
