

Francisco Javier Garcia Moreno

Data Engineer | Databricks, Google Cloud, AWS and Azure

Data that arrives on time, clean and ready for decisions.

Profile

Behind every good decision there is a piece of data someone trusted: my job is to make that data worth the trust. Data engineer with 5+ years designing ETL/ELT pipelines and medallion architectures on GCP, AWS and Azure (Databricks, BigQuery, PySpark, Airflow, SQL) for banking, retail, logistics and education, with automated tests and controlled deployment.

−45% processing time · Banco Falabella	**< 1 min** was 3 h · migration to Google Cloud	**+35%** data adoption · Factor IT	**−100%** manual work in Excel · BBVA

Professional experience

Scala Learning Data Engineer — July 2026 – Present

4 medallion pipelines on Databricks; 15 Gantt plans consolidated; 96 automated SQL tests

- **Built 4 medallion pipelines** (Bronze, Silver, Gold) on Databricks Serverless over AWS S3 and Unity Catalog, with Delta tables, incremental MERGE loads and historical snapshots.
- **Automated the academic calendars** by consolidating 15 Gantt plans from Google Drive into Gold tables per partner university, reprocessing only the files that change.
- **Modeled student course enrollments** with cohort, term and course catalogs, validated by 96 automated SQL tests.
- **Integrated the SurveyMonkey API** and automated survey audiences, which are now generated from the academic calendar.

Databricks Serverless, Unity Catalog, Delta Lake, Spark, Incremental MERGE, Medallion Architecture, Python, SQL, AWS S3, Jobs as code, GitLab, Google Drive API

Banco Falabella Data Engineer — January 2023 – March 2026

−45% processing time; 3 clouds integrated (GCP, AWS, Azure); 100% sensitive ingestion encrypted

- **Cut processing times by 45%** by migrating critical on-premises systems to GCP, AWS and Azure using a medallion architecture.
- **Designed data lakes and ETL/ELT pipelines** that centralize distributed processing in Databricks and each cloud's warehouse (BigQuery, Redshift, Synapse).
- **Secured sensitive data ingestion** into the Raw/Bronze layer of the data lake, with cloud encryption.

GCP, AWS, Azure, Python, Scala, Databricks, BigQuery, Redshift, Synapse, Airflow (Composer, MWAA), Medallion Architecture

Factor IT Data Engineer — April 2022 – January 2023

+35% data adoption

- **Increased data adoption by 35%** with cloud ETL pipelines that feed analytical models.
- **Organized data into bronze, silver and gold layers** using a medallion architecture.

Databricks, PySpark, Medallion Architecture, ETL pipelines

BBVA Data Engineer — November 2021 – April 2022

100% manual Excel work eliminated

- **Eliminated manual Excel work** by automating extractions from transactional databases to the cloud with Python.
- **Turned raw data into analytical views** with distributed processing on Databricks.

Python, Databricks, Power BI, IBM Cognos, Semantic layers, Automated extraction

Aviomar Grupo Empresarial Data Process Engineer — February 2020 – October 2021

+200% operational accuracy; 3 companies centralized in one architecture

- **Improved operational accuracy by 200%** with a cloud data architecture I designed from scratch for three group companies.
- **Integrated core systems (CRM, ERP, WMS)** through ETL processes into a single source of corporate data.

PostgreSQL, Cloud databases, CRM/ERP/WMS integration, ETL pipelines

Selected projects

Projects with real public data, from the source to bronze, silver and gold layers. The code and charts are on GitHub and in the web portfolio.

Public health surveillance (SIVIGILA)

780,910 real weekly cases from Colombia's National Health Institute matched against DANE's DIVIPOLA: three schemas unified, codes completed and 2021 municipalities found by name; 98.5% reach silver and the rest are set aside with their reason (Python, Pandas, BigQuery, Cloud Composer).

Interest rates in Colombia

Twenty years of the Financial Superintendence's weekly report (732,673 rows): encoding repaired, duplicates from an institution changing its name, rates weighted by amount and the intermediation margin (Python, Pandas).

Sales of an online retailer

A million real invoice lines (Online Retail II, UCI): detects the sales repeated in both sheets of the workbook (22,523 lines) and sets aside duplicates, charges and zero prices; 18.9 million pounds net (Python, Pandas, BigQuery).

Other personal projects

What to recommend from real baskets Python, statistics

Workplace absenteeism Python, dimensional model

Data cleaning: World Bank GDP Python, Pandas

FinTrust data pipeline BigQuery, SQL, Python

Academic calendars on Databricks Databricks, PySpark, S3

Banking and e-commerce agent LangChain, FAISS

Seguros AltaVida Python, BigQuery

Technologies

Languages
Python, SQL, Scala, PySpark

Data platforms
Databricks, BigQuery, Delta Lake, Unity Catalog, Redshift, Synapse, PostgreSQL

Cloud
Google Cloud, AWS, Azure

Orchestration
Airflow (Cloud Composer, MWAA), Azure Data Factory, Databricks jobs

Analytics and AI
Power BI, Tableau, Looker Studio, Pandas, Scikit-learn, NLTK, LangChain, FAISS, Vertex AI

Practices
Medallion architecture, incremental MERGE loads, idempotent loads, data quality, dimensional modeling (star schema), automated SQL tests, Git and merge requests

Education

Data Engineer (certification)
Platzi
2021

Master's Degree in Integrated Management Systems (Data Engineering)
Universidad Internacional de La Rioja (UNIR)
2018 – 2020

Industrial Engineer
Universidad Jorge Tadeo Lozano
2014 – 2018

Languages

Spanish (native) · English (limited working proficiency)
